Bandwidth of two-core optical cable

Overview

OM1 vs OM2 vs OM3 vs OM4 vs OM5 Multimode Fiber Guide | EDGE Compare OM1, OM2, OM3, OM4, and OM5 multimode fiber specs, distances, bandwidth, and applicati.

Key Takeaways

The bandwidth of a two-core optical cable depends on the fiber type, with OM2 multimode fiber supporting up to 500 MHz·km and single-mode fiber capable of much higher data rates over long distances.

Multimode Fiber Bandwidth

For multimode fibers, the bandwidth is determined by the modal bandwidth and the distance of transmission: OM1 (62. 5 µm core): 200 MHz·km, suitable for 1 Gbps up to 275 meters and 10 Gbps up to 33 meters (LED source). OM2 (50 µm core): 500 MHz·km, supports 1 Gbps up to 550 meters and 10 Gbps up to 82 meters.

OM3 (50 µm, laser-optimized): 2000 MHz·km, supports 10 Gbps up to 300 meters, 40/100 Gbps up to 100 meters. OM4 (50 µm, laser-optimized): 4700 MHz·km, supports 10 Gbps up to 550 meters, 40/100 Gbps up to 150 meters. OM5 (50 µm, wideband multimode): 28000 MHz·km, designed for short-wavelength division multiplexing (SWDM), supporting multiple 28 Gbps channels over 850–953 nm.

The two cores in a cable can operate independently, effectively doubling the potential data throughput if each core is used for separate channels.

Single-

Mode Fiber BandwidthSingle-mode fiber (SMF) has a much smaller core (8–9 µm) and supports long-distance, high-speed transmission: Typical bandwidth is limited by the electronics rather than the fiber itself. Can carry 10 Gbps to 100 Gbps over tens of kilometers without significant modal dispersion. Two-core single-mode cables can similarly double the effective data channels if each core is used independently.

Practical Considerations

Distance vs. speed: Higher data rates reduce the maximum distance due to dispersion and attenuation. Transceivers: LED sources are used for OM1/OM2, while VCSEL lasers are used for OM3–OM5 for higher speeds. Network design: Two-core cables are often used in duplex configurations, with one core for transmit and one for receive, or for parallel data streams to increase total bandwidth.

In summary, a two-core multimode cable using OM2 fiber can support up to 500 MHz·km, translating to 1 Gbps over 550 meters or 10 Gbps over 82 meters, while single-mode two-core fiber can support much higher speeds over kilometers. The actual bandwidth depends on fiber type, distance, and transceiver technology.

1. Introduction: The Fiber Optic Divide Fiber optic cables are categorized by how they transmit light: Single-mode (OS1/OS2): Guides light in a single, straight path through a tiny 9µm

Opti-Core Fibre Optic Indoor Cable 2 to 96-Fibres EuroClass ...

Opti-CoreTM Fibre Optic Indoor Cable, 2 to 96-Fibres, EuroClass Eca and Dca for EMEA

Multi-mode optical fiber

Fibers that meet this designation provide sufficient bandwidth to support 10 Gigabit Ethernet up to 300 meters. Optical fiber manufacturers have greatly refined their manufacturing process since that

How Many Cores Do You Need in Your Fiber Optic Cable?

One key factor is the number of cores, which impacts how much data you can transmit. This post will guide you through understanding fiber optic cores and selecting the perfect cable for...

Single Mode vs. Multimode Fiber: Core Differences and Selection Guide

How do you choose between single mode and multimode fiber? Compare their differences in core size, light source, bandwidth, transmission distance, and cost to identify the right application.

Single-Mode Optical Fiber

It can transmit higher bandwidth than multimode fiber but requires a light source with a limited spectral range. The terms single-mode optical fiber, single-mode fiber, and mono-mode fiber

Fiber-optic cable

A multi-fiber cable Optical fiber consists of a core and a cladding layer, selected for total internal reflection due to the difference in the refractive index between the

Multimode vs Single Mode Fiber Optic Cables: A Complete Guide to

2. Fiber Optic Basics: How Light Transmits Data To grasp the difference between multimode and single mode, start with the fundamentals of how fiber optics work. At its core, a fiber

Optical networks

An optical transport network is a high-speed communication system that sends light signals over fiber-optic cables to move large amounts of data across long

Fiber Optic Basics
