Cable tray as a winnowing basket

Overview

Resources for wire basket tray system installations Our wire basket tray models, videos, and literature help you plan and specify cable management systems faster.

Key Takeaways

A cable tray could theoretically function as a winnowing basket due to its perforated design, but practical limitations exist.

Structural Suitability

Cable trays are designed to support and organize electrical cables, featuring a flat, wide bottom with regular slots or holes for ventilation and drainage, and slightly raised sides to prevent cables from slipping off. This perforated design is similar in concept to a winnowing basket, which allows lighter chaff to pass through while retaining heavier grains. Wire mesh baskets, often used in cable management, also have open designs that enhance airflow and could be more effective for winnowing.

Practical Considerations

Hole Size: Cable trays typically have slots sized for cable ties and drainage, which may be too large or too small for separating grains effectively. Winnowing requires holes that allow chaff to pass while retaining seeds. Material: Most cable trays are made of steel or galvanized metal, which is durable but heavier than traditional woven baskets.

This could make manual winnowing more cumbersome. Flexibility: Unlike traditional baskets, cable trays are rigid and not easily shaken or tilted, which may reduce efficiency in separating chaff from grain. Airflow: The open design allows some airflow, but the rigid structure may not create the same turbulence as a woven basket, potentially reducing winnowing effectiveness.

Alternative Options

If the goal is to use a metal or mesh structure for winnowing, a wire basket or perforated tray with appropriately sized holes may be more suitable. Wire baskets are lightweight, ventilated, and easy to handle, making them closer in function to a traditional winnowing basket.

Conclusion

While a cable tray could be repurposed for winnowing in a pinch, its rigid structure, hole size, and weight may limit efficiency. For better results, a wire mesh basket or custom perforated tray would provide similar airflow and particle separation while being easier to handle.
