Key Takeaways

Use a cable tray reducer or select a smaller tee to safely transition to a reduced tray size while maintaining proper cable support and airflow. Using a Cable Tray ReducerA cable tray reducer is a specialized fitting designed to connect a larger tray to a smaller one, allowing a smooth transition without stressing the cables or compromising system integrity. When reducing a tee: Select a reducer that matches the existing tray width and the desired smaller size.

Ensure the reducer maintains proper support and alignment for the cables. Use ventilated or solid-bottom reducers depending on heat dissipation and cable type requirements. Selecting a Smaller TeeIf a reducer is not used, you can replace the existing tee with a smaller tee that fits the reduced cable load: Calculate the required tray width based on the number and type of cables using standard sizing methods.

Ensure the new tee provides adequate load capacity and complies with NEC or IEC standards. Maintain proper support spacing to prevent sagging or overloading at the junction.

Practical Considerations

Cable fill and airflow: Avoid overcrowding; maintain space for heat dissipation and future expansion. Structural integrity: Verify that the smaller tee or reducer can handle the combined weight of all cables and environmental loads. Installation: Use splice plates or fasteners to secure the reducer or new tee, ensuring a continuous, stable cable path.

By using a cable tray reducer or selecting a smaller tee based on calculated cable requirements, you can safely reduce the size of a cable tray tee while maintaining system reliability, proper airflow, and compliance with electrical standards.
