Cold Aisle Data Center Solution

Overview

Cold aisle containment systems use doors at aisle ends, ceiling panels or lids above racks, and structural frames to create enclosed zones where cold supply air flows directly to IT equipment intakes. Without containment, cold supply and hot exhaust air mix throughout the data. Hot aisle and cold aisle containment are foundational concepts in data center design. When implemented correctly, they improve efficiency, reduce energy consumption, extend equipment life, and enhance overall reliability. Adopting a cold and/or hot aisle containment solution increases air efficiency, translating to increased up-times, longer. Upsite AisleLok containment solutions and portfolio of aisle airflow management products are designed to improve cooling effectiveness and efficiency by enhancing airflow management. Separates supply and return airflow paths. Supports the highest level of containment for maximum efficiency.
