# Distribution box circuit failure and fire

## Overview

Electrical fires originating from distribution boxes are a serious threat to property and safety. Often, homeowners are unaware that the root cause lies hidden behind the panel, in the quality of the Molded Case Circuit Breaker (MCCB). The causes of small power distribution unit fires usually include the following aspects: Electrical overload: Too many electrical devices are running at the same time, resulting in excessive current in the small power distribution unit and overheating. Wire short circuit: The wire is aged, damaged. There may be many reasons for frequent fires in meter box and small power distribution units: Overload current: If electrical equipment connected to a circuit uses more current than the meter box and small power distribution unit can handle, wires and connection points may overheat, causing a fire. Healthy equipment can fail due to extreme currents, extreme voltages, mischievous animals, severe weather, and many other causes. Sometimes equipment will fail spontaneously for reasons such as chronological age, thermal age, state of chemical decomposition, state of contamination, and state of. In 2020–2024, local fire departments responded to an estimated annual average of 46,652 home electrical structure fires. This estimate includes structure fires where the factor contributing to ignition was an electrical failure or malfunction or electrical distribution, lighting, or power transfer.
