Dual-fiber cable interface

Overview

Budget & simplicity: you can keep existing copper gear and upgrade the link where you need it most—the cable run. Use two fibers: one dedicated to TX, the other to RX. Both sides transmit and receive at the same wavelength (common values: 850 nm MM, 1310 nm/1550 nm SM). Fiber media converters quietly solve a big, practical problem: they bridge copper Ethernet to fiber and extend links far beyond copper's reach. They are great for city networks or 5G systems. Choose dual fiber transceivers if your network needs strong. In the pursuit of seamless connectivity, BiDi (Bidirectional) optical modules offer the advantage of conserving optical fiber resources in optical communication. How do we choose, and what are their differences and advantages?

Let's learn about this! What is a Single-Fiber (BiDi) Transceiver?

Single fiber module also called BiDi transceiver or WDM module. The Cisco ® 10GBASE SFP+ modules (Figure 1) give you a wide variety of 10 Gigabit Ethernet connectivity options for data center, enterprise wiring closet, and service provider.
