Fiber Distribution Box Clamp Installation

Overview

Plug the connectors from the distribution cable into the appropriate fiber optic coupler. Any unused fibers can be routed to the side the box for future use.

Key Takeaways

Proper installation of fiber distribution box clamps ensures secure, organized, and damage-free fiber management.

Preparing the Distribution Box

Before installing clamps, open the distribution box by loosening the screws and carefully lifting the clips, ensuring the cable grommets face toward you. Remove the splice tray and any pre-installed cable tie-downs to provide clear access for cable placement. If the cable has a protective jacket, measure and mark approximately 27 inches from the cable end to guide grommet placement.

Installing the Cable Clamps

Feed the grommet over the cable past the marked point on the jacket to protect the fibers and provide strain relief. Remove the cable jacket at the mark and trim any aramid fibers to prevent interference with the clamp. Wrap electrical tape around the cable where the clamp will be installed to ensure a snug fit and prevent slippage.

Position the cable clamp in the designated area of the distribution box, ensuring the cable is properly seated and aligned. Secure the clamp using screws or fasteners provided, making sure the cable is held firmly without excessive pressure that could damage the fibers. Reinstall the splice tray and route fibers around the outer oval of the tray, ensuring each strand of patch cables fits into a single slot within the clamp area.

Reinstall patch cable clamps if applicable, securing all connections and maintaining proper fiber organization.

Final Steps

After clamps are installed, close the distribution box and ensure the side clips click audibly. Secure the box with the security hex bolt and mount it to the wall or designated surface. Verify that all cables are properly anchored, with no sharp bends or tension points, to maintain signal integrity and prevent mechanical damage.

Tips for Safe Installation

Avoid sharp bends and excessive tension on the fiber cables during clamp installation. Use figure-8 loops when laying fiber to prevent twisting. Ensure clamps are compatible with the cable type and diameter to avoid crushing or slippage.

For outdoor installations, consider weatherproof clamps and grommets to protect against environmental stress. Following these steps ensures that fiber distribution box clamps are installed securely, maintaining both the mechanical stability and performance of the fiber optic network.
