Laying optical cable in pipeline well

Overview

Installation Considerations for Pipelines All three of the distributed fiber optic sensing technologies can be used in monitoring pipelines, as each provid.

Key Takeaways

Optical cables in pipeline wells should be installed using robust, protected configurations that ensure long-term reliability under harsh downhole conditions.

Cable Selection and Design

For downhole applications, permanent fiber-optic cables are typically used, designed to withstand high pressure, elevated temperatures, mechanical shock, and corrosive fluids. A common design is the tube-in-tube configuration, where optical fibers are housed in a hermetically sealed stainless steel or INCONEL tube, often filled with protective gels to prevent microbending and chemical ingress. The outer tube provides mechanical shielding, while additional polymer layers centralize and buffer the fiber, ensuring strain-free deployment and operation.

Placement in the WellCentralization: The cable should be centralized within the wellbore to avoid contact with the casing or tubing, reducing mechanical stress and abrasion. Routing: Plan the cable path carefully, considering bends, splices, and connection points. Avoid sharp bends that exceed the cable's minimum bend radius.

Securing: Use mechanical supports or clamps to prevent movement during deployment and operation. In pipelines, cables can be installed in conduits or directly within the pipeline well, depending on environmental conditions.

Installation Methods

Mechanical Pulling: Optical cables can be pulled manually or with mechanical winches through the wellbore or pipeline conduit. Bypass Techniques: In complex well geometries, mechanical bypass or guide systems may be used to navigate obstacles without damaging the cable. Protection: In pipeline wells, armoring may not be required if the environment is controlled, but in harsh or abrasive conditions, armored or reinforced cables are recommended.

Monitoring and Maintenance Considerations

Distributed Sensing: Optical cables can support Distributed Temperature Sensing (DTS), Distributed Acoustic Sensing (DAS), and Distributed Strain Sensing (DSS), providing continuous monitoring of well conditions. Strain Management: Ensure that the cable is installed to allow efficient strain transfer for sensing applications while avoiding overstressing the fibers. Controlled prestressing during fabrication can help maintain fiber integrity.

Environmental Protection: Consider chemical resistance, temperature tolerance, and mechanical protection to ensure long-term performance in the well environment.

Summary

Proper placement of optical cables in pipeline wells involves selecting robust, tube-in-tube or armored cables, centralizing and securing them within the wellbore, carefully planning routing and bends, and using appropriate installation methods to minimize mechanical stress. These practices ensure reliable operation for sensing and communication applications over the life of the well.

Installation method of buried optical cable and pipeline optical cable

The use of communication optical cables is more adaptive laying of optical cables such as overhead, buried, pipeline, and underwater. The conditions for laying each optical cable also

OF Cable Laying Process Guide | PDF | Trench

OF Cable Laying Process Guide The document discusses procedures for laying optical fiber cables, including inspection of routes, trenching, pipe selection and laying, and manhole types.

FOA Standard For Installing Fiber Optic Cable Plants

This standard describes procedures for installing and testing cabling networks that use fiber optic cables and related components to carry signals for communications, security, control and similar purposes.

OFC Laying Practices and Guidelines | PDF | Rope | Optical Fiber

This document provides guidelines for laying optical fibre cables, including detailed surveying the cable route, soil categorization, recommended pipe types for cable protection,

Method for installing a sensing cable along a pipeline

Efficient pipeline monitoring can be achieved with the help of optical based distributed sensing method and provides long term information on the pipeline integrity.

OptaSense Cable Implementation Guide for Pipelines

This technical guide provides the OptaSense customer with the necessary background to make an informed decision on how best to select and install a fibre optic cable for monitoring purposes in a

Method for installing fiber on production casing

The method further includes applying pressure to the adhesive to adhesively bond the optical fiber cable to the production casing along a length of the production casing while the production...
