New Zealand Level 3 Distribution Box Configuration Standards

Overview

Australian/New Zealand Standard The objective of this Standard is, in conjunction with Part 1 of the series, to define specific requirements for distributi.

Key Takeaways

Level 3 distribution boxes in New Zealand are designed to comply with AS/NZS 61439 standards, offering flexible pole configurations and mounting options for domestic, commercial, and industrial applications.

Overview

Level 3 distribution boxes, also referred to as distribution switchboards or panelboards, are used to safely distribute electrical power from the main supply to various circuits. They are designed to provide reliable performance, user-friendly installation, and compliance with New Zealand electrical standards.

Configuration Options

Pole Counts: Distribution boxes are available in 1–36 poles, depending on the application. Compact insulated pole covers typically handle 1–8 poles, while surface or flush-mounted loadcentres can accommodate 8–36 poles. Rugged metal loadcentres are available for 8–24 poles.

Mounting Types: Options include surface-mounted and flush-mounted enclosures. Surface-mounted boxes are easier to access, while flush-mounted boxes provide a cleaner aesthetic in commercial or residential settings. Enclosure Materials: Boxes can be made from metal, fibreglass, or PVC-U, with coastal installations favoring fibreglass, PVC-U, or stainless steel for corrosion resistance.

Panelboard Features: Level 3 panelboards are design-verified to AS/NZS 61439, ensuring safety, performance, and reliability. They are suitable for domestic, commercial, industrial, and mining sectors.

Installation Considerations

Accessibility: The distribution box should be located to allow a short mains cable route and easy access for maintenance. Security: Lockable boxes are recommended if additional security is required, with a window for meter reading if a smart meter is not installed. Integration: Boxes can incorporate earth leakage-protected outlets and be positioned during construction to avoid additional metering or grid connection work.

Compliance

All Level 3 distribution boxes in New Zealand must comply with AS/NZS 61439, which governs the design, testing, and performance of low-voltage switchgear and controlgear assemblies. This ensures that the boxes meet safety, reliability, and operational standards for various electrical applications.

Summary

In New Zealand, a Level 3 distribution box configuration involves selecting the appropriate pole count, enclosure type, and mounting method, while ensuring compliance with AS/NZS 61439. These boxes are versatile, suitable for multiple sectors, and designed for safe, reliable, and efficient power distribution. Proper installation includes considerations for accessibility, security, and integration with the building's electrical system.
