OLT device optical module luminous value

Overview

Explore the different classifications of OLT equipment, understanding each type''s unique functions and applications.

Key Takeaways

The luminous value of an OLT optical module refers to its transmit (Tx) and receive (Rx) optical power, typically ranging from -8 dBm to +3 dBm for GPON modules, with thresholds monitored for alarms.

Understanding Optical Power in OLT Modules

An OL

T (Optical Line Terminal) serves as the service provider endpoint in a passive optical network (PON), converting electrical signals to optical signals for transmission to ONUs (Optical Network Units) and vice versa ( ).

Each OL

T port uses an optical module, which may be GPON, XGS-PON, 10G-EPON, or other PON standards ( ). The luminous value of an optical module is measured as: Transmit power (Tx): The optical power emitted by the OLT module into the fiber. Receive power (Rx): The optical power received from the ONU or downstream fiber.

These values are critical for ensuring proper signal quality and network performance. If the optical power is too low, the signal may not reach the ONU reliably; if too high, it can damage the receiver or cause errors.

Typical Optical Power Ranges

While exact values depend on the module type and manufacturer: GPON OLT modules: Tx power typically ranges from +0. 5 dBm to +5 dBm, Rx sensitivity from -28 dBm to -8 dBm. XGS-PON or 10G-EPON modules: Tx power may range from 0 dBm to +4 dBm, with Rx sensitivity around -27 dBm to -8 dBm ( ).

OL

T modules often include alarm thresholds for optical power. For example, if the received signal falls below a minimum threshold or exceeds a maximum threshold, the module triggers an alarm to indicate a potential fiber fault or misalignment ( ).

Monitoring and Displaying Optical Power

Most OL

Ts support Digital Diagnostic Monitoring (DDM) or Digital Optical Monitoring (DOM), allowing operators to view real-time Tx and Rx power, voltage, current, and temperature: Commands like display transceiver interface on Huawei devices show the optical power and module status ( ). Monitoring ensures the optical module operates within safe luminous values and helps detect fiber degradation, connector issues, or ONU misconfigurations.

Key Considerations

Always use manufacturer-certified optical modules to ensure correct power levels and avoid damage ( ). Optical power values vary with fiber length, split ratio, and network topology. Regular monitoring helps maintain signal integrity and prevents service interruptions.

In summary, the luminous value of an OLT optical module is a measure of its optical transmit and receive power, typically within a few dBm, and is monitored to ensure proper network operation and trigger alarms if thresholds are exceeded ( ).
