Phase connection wire of distribution box

Overview

Hey, in this article we are going to see the Single Phase Distribution Box Wiring Diagram and Connection Procedure.

Key Takeaways

The phase (live) wire is connected to the input terminal of the main MCB or isolator, then distributed to branch MCBs or RCCBs according to the wiring layout.

Main Phase Connection

The incoming phase wire from the utility or energy meter is first connected to the main isolator or main MCB. This serves as the primary control point for the electrical system, allowing the entire distribution box to be switched on or off safely. For single-phase systems, a double-pole MCB is often used as the main switch, handling both phase and neutral if required.

Distribution to Branch Circuits

From the main MCB, the phase wire is routed to the input of the RCCB (Residual Current Circuit Breaker) if one is installed.

The RCC

B protects against earth leakage and ensures safety from electric shocks.

After the RCC

B, the phase wire is connected to the input terminals of individual branch MCBs. For single-pole MCBs, only the phase wire is connected to the breaker, while the neutral bypasses the breaker and connects directly to the neutral busbar. For double-pole MCBs, both phase and neutral wires are connected to the breaker, and both are disconnected when the breaker trips.

Wiring Direction and SafetyLeft-to-right wiring: Typically, wiring from the main breaker to branch breakers is arranged on the left side, and outgoing wires to loads are on the right. Binding and labeling: Wires should be neatly tied with plastic ties, and all phase wires should be clearly marked to indicate voltage and type of supply. Earth connection: The protective earth (PE) wire is connected to the earth busbar, which is linked to the earth pit and metallic parts of the distribution box for safety.

Summary of Steps

Connect the incoming phase wire to the main MCB or isolator. Route the phase wire from the main MCB to the RCCB input (if used). Connect the phase wire from the RCCB output to branch MCBs.

Connect the neutral wire to the neutral busbar and the earth wire to the earth busbar. Ensure all wires are properly tied, labeled, and inspected for safety before energizing the system. Following this sequence ensures that the phase wire is correctly distributed, providing overcurrent protection, earth leakage protection, and safe operation of all connected loads.
