Random noise of optical modules

Overview

Optical systems can be subject to shot noise and optical noise, in addition to the standard thermal noise. These require somewhat different models and performance expressions.

Key Takeaways

Random noise in optical modules arises from inherent fluctuations in light and electronic components, including shot noise, thermal noise, dark noise, and amplifier-induced noise, all of which can degrade signal quality. Types of Random Noise1. Shot Noise (Photon Noise): Shot noise is caused by the discrete nature of photons and electrons.

In photodetectors, the arrival of photons is random, leading to fluctuations in the generated current even under constant illumination. This noise follows Poisson statistics and is often approximated as Gaussian for practical analysis, with its power proportional to the average optical signal intensity. 2.

Thermal Noise (Johnson-Nyquist Noise): Thermal noise originates from the random motion of electrons in resistive components of the optical module, such as load resistors or amplifier circuits. It is independent of the optical signal and is modeled as a stationary Gaussian process with a flat spectral density up to high frequencies. 3.

Dark Noise / Dark Current: Even in the absence of light, photodetectors like CCDs or CMOS sensors can generate a small current due to imperfections in the semiconductor and thermal excitation. This dark current contributes to noise, particularly in low-light conditions, and can combine with shot noise to affect measurement accuracy. 4.

Relative Intensity Noise (RIN) and Multiplicative Noise: RIN arises from fluctuations in the optical source itself, such as laser intensity variations. Unlike additive noise, RIN is proportional to the signal and can degrade the signal-to-noise ratio (SNR) in optical communication systems. 5.

Amplifier Noise: Optical amplifiers introduce additional noise, including amplified spontaneous emission (ASE), which adds random fluctuations to the signal. Avalanche photodiodes (APDs) also contribute multiplication noise due to the stochastic nature of the avalanche process. Impact on Optical SystemsRandom noise reduces the signal-to-noise ratio (SNR), limits the sensitivity of receivers, and can cause errors in optical communication or sensing systems.

In low-light or high-speed applications, shot noise and thermal noise are often the dominant contributors, while in high-power systems, RIN and amplifier noise become significant.

Mitigation Techniques

Filtering: Optical and electronic filters can reduce noise bandwidth and suppress unwanted frequency components. Signal Processing: Techniques like averaging, correlation, and adaptive filtering help mitigate noise effects. Optimized Design: Careful selection of photodetectors, low-noise amplifiers, and stable optical sources reduces intrinsic noise.

Temperature Control: Cooling photodetectors can reduce dark current and thermal noise. Understanding and managing these noise sources is crucial for designing high-performance optical modules in communication, sensing, and imaging applications.

Article Content

Optical Noise

Optical systems can be subject to shot noise and optical noise, in addition to the standard thermal noise. These require somewhat different models and performance expressions. Receiver

Sources of Noise in Devices

PDF file

NOISE IN FIBER OPTIC COMMUNICATION LINKS Robert Dahlgren

The physics of noise in optical communication links is of great interest in the design of fiber optic communication systems. In this report the role of noise in optical communications, and how it can

The Ultimate Guide to Optical Noise

© 2026 FD SOLUCIONES OPTICAL SYSTEMS - All rights reserved

Discover the causes of optical noise, its effects on signal quality, and practical methods to minimize its impact on optical communication systems.

Lecture15_228B_S07_Final.ppt

Electrical Shot Noise The shot noise generated in the photodetection process is physically due to the “quantum granularity” of the received (and photo converted) optical signal

Noise in Laser Technology — Part 1: Intensity and Phase Noise

Abstract: Lasers can exhibit various kinds of “noise”, with manifold influences on applications. Here we discuss where such noise can come from, how it is quantified and how its influences can be

Jitter Series Part 2: Using OpticStudio STAR module to analyze

Optical systems in aerospace industry often experience random vibration excited by internal and external forces, ranging from engine noises, scanning motions, cryogenic cooling in

Modal Noise

If the speckle pattern changes with time, it will induce the fluctuation in the received optical power, known as the modal noise. The modal noise is inversely proportional to the laser linewidth, so it is a

An Accurate and Realistic Channel Simulator of Optical Wireless ...

In this paper, a novel channel simulator framework to optical wireless communication systems is proposed, which can jointly learn the deterministic noise and random noise of the real channel

Analysis of Fundamental Photodetection Noises and Evaluation of

Fourth, interpretation and explanation of simulation results implemented by the Optisystem software through the optical high debit communication system chosen to analyze the photodetection noises

Noise Principles in Optical Fiber Communication

This chapter contains sections titled: Introduction Receiver Thermal Noise Dark Shot Noise Signal Shot Noise Multiplication Shot Noise Optical Amplification and Beat Noises Optical Nois...

NOISE IN FIBER OPTIC COMMUNICATION LINKS Robert Dahlgren Bob.Dahlgren@ieee

Noise is defined as the deviation from an ideal signal, and is usually associated with random processes. By definition it corrupts t he information content and fidelity of the signal, particularly at low levels. In

4 ways signal noises impact optical devices

Shot noise, dark noise, 1/f noise, and thermal noise are all types of optical noises that can impact a sensor''s performance. Learn how these various optical noises affect sensor accuracy and

Noise Models in Optical Wireless Communication Systems

Optical wireless communication has received widespread attention as a high-speed, high-bandwidth communication technology. However, noise is an important limiting factor in system

Optical Signal to Noise Ratio (OSNR)

Optical Signal to Noise Ratio (OSNR) is the measure of the ratio of signal power to noise power in an optical channel. OSNR is important because it suggests a degree of impairment when the optical

Optical Receiver Noise

Optical receivers convert incident optical power Pin into electric current through a photodiode. The relation Ip = RPin assumes that such a conversion is noise free. However, this is not the case even

Does Fibre Optic Cabling have any potential for noise?

After Google searching "Do Fibre Optic Cables attract any noise", most results return that they attract virtually no noise. Is this the case or are there some exceptions?

optical noise | Photonics Dictionary | Photonics Marketplace

Optical signals typically involve the transmission of light, and various factors can introduce noise into the system, leading to signal degradation. Some sources of optical noise include: Photon noise: This

Noise Pulses in Large Area Optical Modules

Large area photomultipliers are widely used in neutrino and astro-particle detectors to measure Cherenkov light in media like water or ice. The key element of these detectors are the so
