Relay protection three-stage protection setting values

Overview

Use this Protection Relay Setting Calculator to calculate pickup current, time multiplier settings (TMS), operating time, coordination time interval (CTI), and plug setting multiplier (PSM) using fault current, CT ratio, and IEC 60255 curve parameters. Purpose: Quickly clears severe faults near the relay (e. Limitation: Covers only ~80% of the line length, leaving a “dead zone” at the far end. Stage Ⅱ (TimeDelayed Overcurrent Protection) Purpose: Protects the remaining 20% of the line and acts as backup. Selective short-circuit protection can be achieved in different ways, such as: Time-graded protection Time- and current-graded protection A straightforward way of obtaining selective protection is to use time grading. The principle is to grade the operating times of the relays in such a way that. Protection relays employ a wide range of configurable parameters to identify defects & trip the breaker in a controlled & selected manner. PSM – Plug Setting Multiplier (Current Setting Multiplier) What is PSM?

2). Time-Delayed Overcurrent Protection (Stage 2): Includes a short.

The reach of the current-graded protection in relation to the total length or impedance of the protected feeder depends on both the SIR-value and the ICS -setting of the current-graded stage.

Relay Protection Settings (PSM, TSM, EL, OL, MF)

Protection relays employ a wide range of configurable parameters to identify defects & trip the breaker in a controlled & selected manner. Understanding each setting facilitates proper relay

FEEDER PROTECTION CALCULATIONS & SETTINGS

Relay 8 backs up relays 6 and 7, and should be co-ordinated with the slowest of these two relays. Relay 7 has an instantaneous setting of 1100 A, which is smaller than the setting of relay 6, and so the

Relay Settings Calculations

To avoid relay mal-operation, set Slope 2 as high as possible. Normally, a high Slope 2 setting causes slow tripping for evolving faults (external-to-internal faults).
