Technical Standards for Duct Optical Cables

Overview

Recommended technical requirements are detailed by reference to IEC 60794-3-11 on outdoor optical fibre cables for duct, directly buried, and lashed aerial applications.

Key Takeaways

Optical cables for ducts must comply with ITU-T L. 100/L. 10 and IEC 60794-3-11 standards, covering mechanical, environmental, and optical performance requirements.

Key Standards and RecommendationsITU-T L. 100 (formerly L. 10) specifies the characteristics, construction, test methods, and performance criteria for optical fibre cables installed in ducts and tunnels using the pulling method.

It references IEC 60794-3-11, which details requirements for outdoor optical fibre cables, including duct, directly buried, and lashed aerial applications. Compliance ensures that cables meet mechanical, environmental, and optical performance standards suitable for duct installations.

Optical Fibre Characteristics

Cables should use single-mode or multi-mode fibres compliant with ITU-T recommendations such as G. 652, G. 653, G.

654, G. 655, G. 656, and G.

657, and IEC 60793-1-50 for dimensional and transmission properties. These standards ensure low attenuation, minimal dispersion, and reliable signal transmission over long distances.

Mechanical and Environmental Requirements

Cables must withstand installation stresses, including pulling tension and bending. Maximum pulling tension and minimum bend radius are specified in manufacturer datasheets; for example, stranded loose tube and ribbon cables may have a maximum pulling tension of 600 lbF (2,700 N), with minimum bend radius calculated as 15 times the cable diameter during installation. Environmental considerations include temperature, humidity, and potential exposure to water or chemicals in ducts and tunnels.

Installation Guidelines

Pulling and blowing methods are used for duct installation. Pulling involves mechanical tension, while blowing uses high-speed airflow to reduce friction and stress on the cable. Cable strain should remain below 0.

5% to prevent long-term damage. Microcables and microducts are increasingly used to reduce diameter, weight, and installation stress, allowing longer installation distances without additional pulling ropes. Bend management: Use figure-eight configurations when unreeled to prevent kinking or twisting, and ensure pull wheels or rollers meet minimum diameter requirements.

Testing and Compliance

Cables are tested for mechanical strength, optical performance, and environmental resilience. ITU-T L. 100 includes electrical continuity tests for metallic elements and recommends performance criteria for duct and tunnel applications.

Compliance is voluntary but ensures interoperability and reliability.

Summary

For optical cables in ducts, adherence to ITU-T L. 100/L. 10 and IEC 60794-3-11 ensures proper mechanical, environmental, and optical performance.

Installation methods, pulling tension, bend radius, and fibre type must be carefully considered to maintain long-term reliability and signal integrity. Manufacturers' datasheets provide specific limits and guidelines for each cable type, and microcable technologies can further optimize installation efficiency and reduce stress on fibres.

Article Content

Recommendation ITU-T L.100 (01/2024)

Recommended technical requirements are detailed by reference to IEC 60794-3-11 on outdoor optical fibre cables for duct, directly buried, and lashed aerial applications. Changes and additions to these

Recommendation L.100/L.10 (05/2021) Optical fibre cables for duct

Recommended technical requirements are detailed by reference to IEC 60794-3-11 on outdoor optical fibre cables for duct, directly buried, and lashed aerial applications. Changes and additions to these

IEC 60794-3-11

This part of IEC 60794 specifies the requirements for optical fibre cables and cable elements which are intended to be used externally in communications networks.

Optical Fibre Cable Technical Specification

This Specification covers the design requirements and performance standard for the supply of optical fibre cable in the industry. XCOM ensures a stable quality control system for our cable products

ITU-T L.100/L.10 (05/21) Optical fibre cables for duct and tunnel ap

Recommendation ITU-T L.100/L.10 describes characteristics, construction, test methods and performance criteria of optical fibre cables installed by pulling method for duct and tunnel

Specification For Installation of Duct(s) for Optical Fibre Cable(s)

This specification covers the minimum requirements for the laying, joining and testing of HDPE (High Density Polyethylene) Duct for Optical Fibre Cable (OFC) either by open cut methods or by

Duct Installation of Fiber Optic Cable

To ensure all specifications are met, consult the specific cable specification sheet for the cable you are installing. Corning Optical Communications cable specification sheets are available which list the

13-SDMS-04 REV. 00 SPECIFICATIONS FOR NON-METALLIC,

The non-metallic fiber optic cable (pullingt type & “mini cable” blown type) shall consist of a central fiber optic unit protected by one or more layers of helically wound anti-hygroscopic tape or yarn.
