Various irregular shapes of cable trays

Overview

Types of Cable Trays: Ladder, Perforated, Basket, Solid Explore all types of cable trays—ladder, perforated, basket, solid, and channel. Learn their uses.

Key Takeaways

Irregular-shaped parts for cable trays include elbows, bends, tees, crosses, reducers, risers, and custom-fabricated fittings that allow flexible routing and support of cables in complex layouts.

Common Irregular-

Shaped Cable Tray Parts

Elbows and Bends: Used to change the direction of a cable tray horizontally or vertically, allowing smooth transitions around corners or obstacles. They are available in various angles, such as 45° or 90°, and can be fabricated to fit specific site requirements. Tees and Crosses: Enable branching of cable trays to multiple directions.

Tees split a single tray into two paths, while crosses allow four-way intersections, facilitating complex network layouts. Reducers and Risers: Reducers adjust the width of a tray to accommodate different cable volumes, while risers change the elevation of the tray to navigate structural elements or equipment.

Custom-

Fabricated Parts: For unique layouts, manufacturers can provide custom bends, offsets, or shaped trays to fit irregular spaces. These are often made from galvanized steel, stainless steel, aluminum, or fiberglass-reinforced plastic (FRP) to match the main tray material. Support and Connection Accessories: Irregular-shaped trays often require additional support elements such as suspension rods, brackets, cross arms, and connecting plates to maintain stability and proper alignment.

Bolt cutters or specialized tools may be used to cut and adjust wire mesh trays for custom configurations. Material ConsiderationsIrregular-shaped parts are typically constructed from the same materials as the main tray system to ensure compatibility and durability. Common materials include: Galvanized Steel: Offers strength and corrosion resistance for industrial environments.

Stainless Steel: Provides high corrosion resistance, suitable for harsh or outdoor conditions. Aluminum Alloy: Lightweight and corrosion-resistant, ideal for areas requiring easy handling.

Fiberglass-

Reinforced Plastic (FRP): Non-conductive and corrosion-resistant, suitable for chemical or wet environments.

Installation Tips

Ensure that bends and elbows maintain the minimum bend radius for cables to prevent damage. Use appropriate support spacing for irregular sections to prevent sagging or mechanical stress. Verify that all fittings and custom parts comply with relevant standards such as DIN EN 61537 for cable support systems.

Irregular-shaped parts are essential for creating flexible, safe, and efficient cable management systems in industrial, commercial, and specialized installations, allowing cable trays to navigate complex layouts while maintaining structural integrity and accessibility.
