What are fireproof boards used for cable trays

Overview

Fire protection for cables & cable trays | FlamroThe mostly combustible cable sheaths and insulation allow a fire to spread along the cable at rapid speed.

Key Takeaways

High-density calcium silicate boards are the primary type of board used for fireproof cable trays. Key Material: High-Density Calcium Silicate BoardsHigh-density calcium silicate boards are widely used in fireproof cable tray systems due to their exceptional fire resistance, thermal insulation, and structural stability. These boards are non-combustible (Class A) and do not produce smoke or toxic gases during a fire, providing protection for cables for 1–2 hours or longer, depending on the design requirements.

Features and Benefits

Fire Resistance: They act as a barrier against flames and high temperatures, maintaining cable functionality during a fire. Thermal Insulation: Their low thermal conductivity reduces heat transfer, protecting cable insulation from overheating. Mechanical Strength: They retain structural integrity under high temperatures, preventing deformation or collapse of the cable enclosure.

Installation Flexibility: Boards can be used to construct box structures that fully encase cables or as encapsulation layers applied directly over existing cable trays.

Specifications

Thickness: Typically ranges from 5–12 mm for effective fire protection. Application: Can be used in straight or arc-shaped cable trays, suitable for both industrial and architectural installations.

Alternative Fire-

Rated Boards

Other fire-rated boards, such as vermiculite boards or specialized fireproof mineral boards, are also used to enhance fire protection in cable tray enclosures. These boards are often applied as coatings or layers over metal trays to meet specific fire resistance standards.

Installation Considerations

Ensure proper sealing at wall or floor penetrations using fire-rated boards and firestop materials. Maintain mechanical stability and alignment of trays to prevent gaps that could compromise fire protection. Periodic inspection is recommended to ensure the integrity of the fireproof boards and coatings.

In summary, high-density calcium silicate boards are the most commonly used and effective boards for fireproof cable trays, providing a combination of fire resistance, thermal insulation, and structural stability, with alternatives like vermiculite boards available for specialized applications.
