What size is the flat iron for the cable tray

Overview

Standard Cable Tray Types and Fittings This document describes the types, materials, dimensions, and fittings for standard cable tray systems. It outlines.

Key Takeaways

The flat iron (rung) size for cable trays depends on the tray type, cable load, and span, with common rung widths ranging from 6 to 48 inches and spacing from 6 to 18 inches.

Ladder Cable Trays

For ladder-type cable trays, which are used for heavy power cables and long spans, the flat iron rungs are critical for load support and cable stability. Standard rung widths are typically 6, 9, 12, 18, 24, 30, 36, 42, and 48 inches, while rung spacing options are 6, 9, 12, or 18 inches. Wider trays and wider rung spacing reduce overall strength, so manufacturers may require load adjustments for the largest sizes (42 and 48 inches) to maintain safety.

For small-diameter control or instrumentation cables, 6, 9, or 12-inch rung spacing is recommended to prevent drooping and maintain neat installation. For large power cables, 9-inch or wider spacing is preferred to accommodate cable bending radii and ease installation.

Perforated and Channel Trays

Perforated trays use a continuous bottom with ventilation holes. The flat iron or bottom support should be sized to balance cable containment and airflow. Channel trays are narrow and compact, suitable for small cable quantities; their flat iron width is limited, and they fill quickly, so careful sizing is required to avoid exceeding NEC fill limits.

Wire Mesh (Basket) TraysFor wire mesh trays, the flat iron equivalent is the wire diameter and grid spacing. These trays are flexible and fast to install, but the wire thickness and support spacing govern load capacity. Conservative sizing is recommended when carrying bundled cables.

Key Considerations

Cable type and size: Ensure the rung width and spacing accommodate the largest cable bending radius without damage. Load and span: Longer spans or heavier cables require closer rung spacing or stronger flat iron to prevent sagging. Code compliance: Follow NEC fill limits (40% for power cables, 50% for control cables) and maintain proper separation for EMI prevention.

Future expansion: Oversize trays slightly to allow for additional cables without overcrowding. In summary, the flat iron size for cable trays should be selected based on tray type, cable load, and support span, with ladder trays typically using 6–48 inch widths and 6–18 inch spacing, while smaller or specialized trays require proportionally smaller flat iron or wire support dimensions to ensure safety, compliance, and ease of installation.
