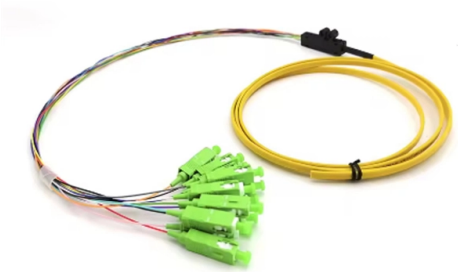
What subcategory does the core switch belong to



Overview

The core switch is the physical core layer. It can be considered a central network layer that performs all the functions, like monitoring traffic and empowering the whole system. In actuality, there are three primary layers of a complex network. Engineered to aggregate massive volumes of data from distribution switches, it provides ultra-low latency and maximum throughput to ensure uninterrupted routing and packet. It is a powerful backbone switch in the center of the network core layer, which centralizes multiple aggregation switches to the core and implements LAN routing. Simply put, it's the kingpin that keeps your network humming. You may also want to know: Can a Nintendo Switch Play DS Games?
