Key Takeaways

Optical wavelength meters (wavemeters) and Optical Spectrum Analyzers (OSAs) are the primary instruments used to measure the wavelength of optical modules. Optical Spectrum Analyzer (OSA)An Optical Spectrum Analyzer is a versatile instrument that measures the spectral composition of light, including wavelength, optical power, and signal-to-noise ratio. It works by dispersing incoming light using diffraction gratings or interferometers and detecting the intensity of each wavelength with a photodetector array.

OS

As are widely used in fiber optic testing, telecom networks, and R&D labs to analyze lasers, LEDs, and optical transceivers. They are particularly useful for identifying chromatic dispersion, laser drift, and unwanted harmonics.

As can operate across common optical communication bands such as the C-band (1530–1565 nm) and L-band (1565–1625 nm) and are available as benchtop or portable units. Wavelength Meters (Wavemeters)A wavelength meter, also called a wavemeter, is a high-precision interferometric instrument designed specifically for measuring the central wavelength of laser sources or optical modules. It typically uses a Michelson interferometer or other interferometric setups to generate an interference pattern, which is analyzed to calculate the wavelength with sub-picometer accuracy.

Wavelength meters are essential for applications requiring absolute wavelength accuracy, such as DWDM channel verification, tunable laser calibration, and optical component validation. Modern devices often provide real-time measurements of wavelength, optical power, and drift, and are factory-calibrated for traceability to international standards. Key DifferencesOSA: Provides a full spectral view, useful for analyzing multiple wavelengths, spectral shape, and noise characteristics.

Ideal for general optical module testing and troubleshooting. Wavelength Meter: Offers extremely precise measurement of a single wavelength or multiple laser lines, critical for calibration and high-accuracy applications.

Practical Use

For testing an optical module, the choice depends on the requirement: Use an OSA when you need to observe the entire spectrum, detect sidebands, or analyze signal quality. Use a wavelength meter when absolute wavelength accuracy is critical, such as in tunable laser calibration or DWDM systems. Both instruments are widely adopted in R&D labs, manufacturing lines, and field testing, ensuring optical modules meet performance and industry standards.

We have developed the AQ6375 Optical Spectrum Analyzer grating-based desktop optical spectrum analyzer, which can measure an optical spectrum over a wide wavelength range from 1.2 to 2.4 m

Photonic and Optical Test

Photonic component analyzers are used to characterize individual optical elements such as lasers, modulators, filters, and photonic integrated circuits by measuring wavelength-dependent behavior,

Wavelength Meters

A wavelength meter is a high-precision optical instrument used to measure the central wavelength of laser sources or broadband light emitters. It operates by capturing the incoming optical signal and

Optical Spectrum Analyzer

An optical spectrum analyzer is an instrument used to measure the spectral density of a lightwave signal at different wavelengths.

Wavelength Meters Selection Guide: Types, Features, Applications ...

Wavelength meters are interferometers used to measure wavelengths of laser beams. The devices are mounted on benches or desktops. They generate numerical values identifying pulsed and continuous

What is an Optical Wavelength Meter?

The optical wavelength meter, also known as an optical wavemeter, is a device used for the accurate measurement of wavelength. It has an interferometer -based approach where the two
